

Using IDC for Estimating Recharge Rates of a MODFLOW Model

Prepared for
IWFM Users Group Meeting

Prepared by
Reza Namvar and Jon Traum
WRIME, Inc.

December 9, 2010

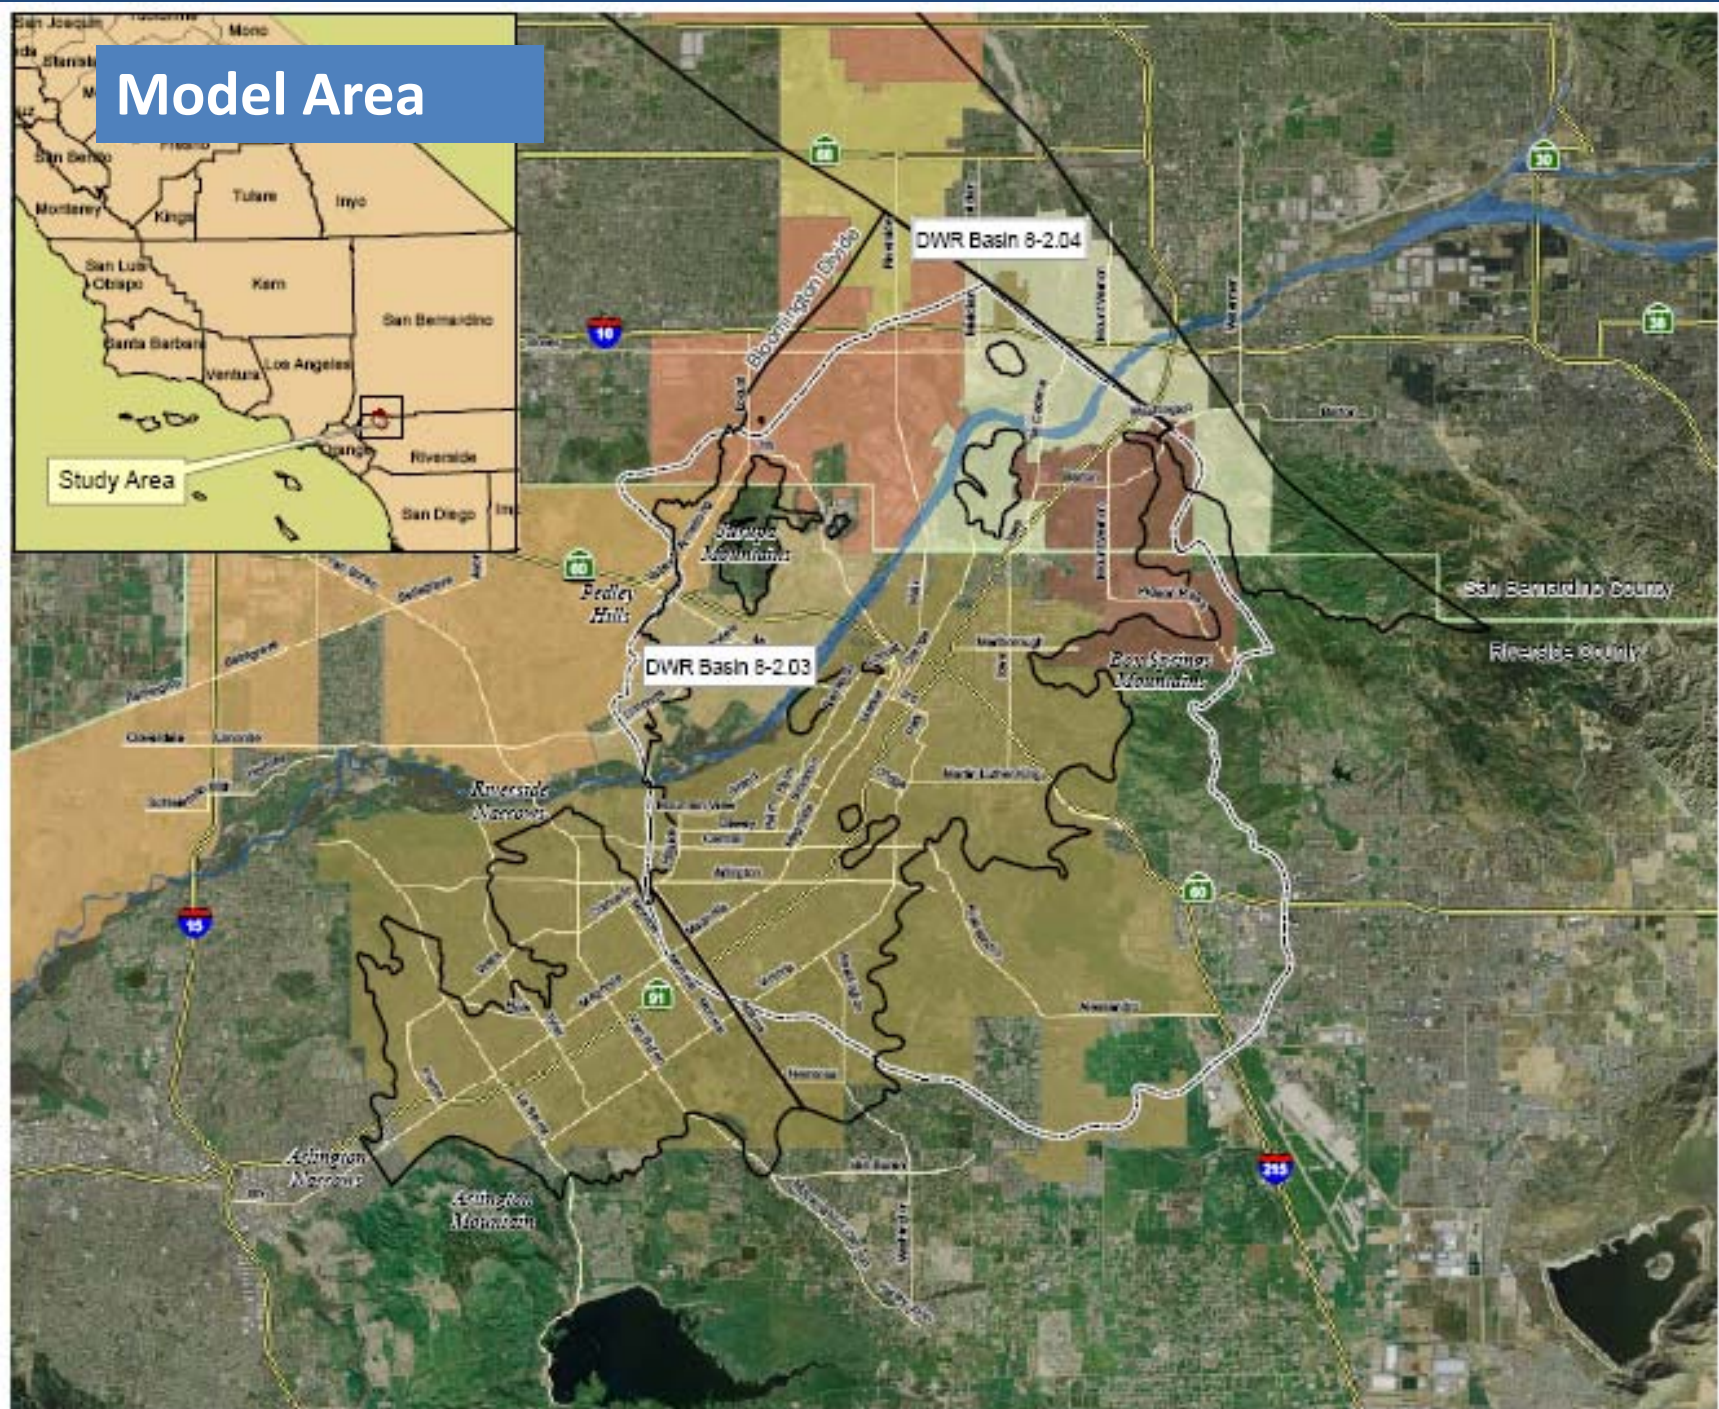

Presentation Outline

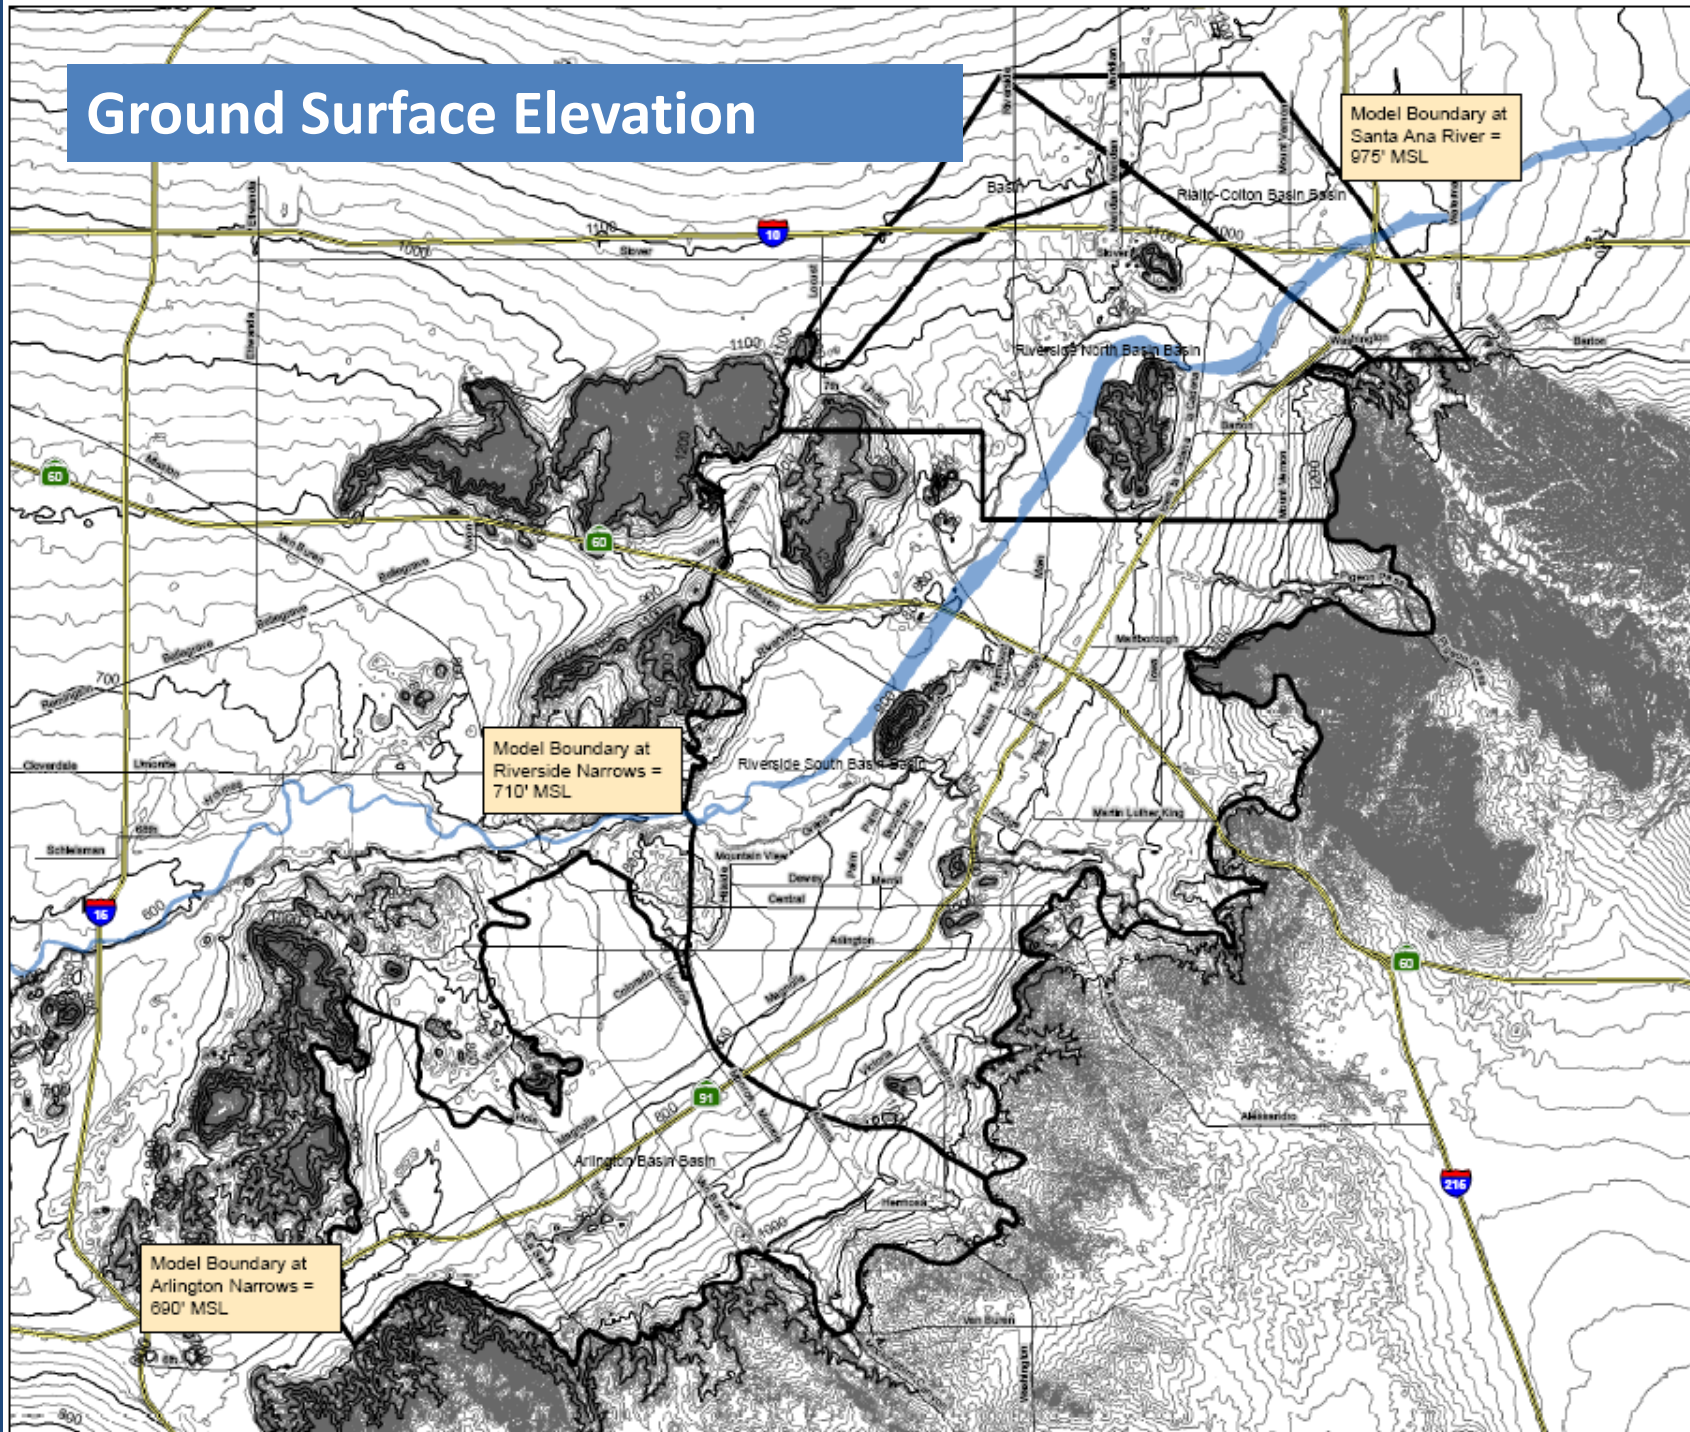

- Model Area
- MODFLOW Model
- IWFM Demand Calculator (IDC) Model
- Consistency of IDC and MODFLOW Recharge Rates
- Model Results

Model Area

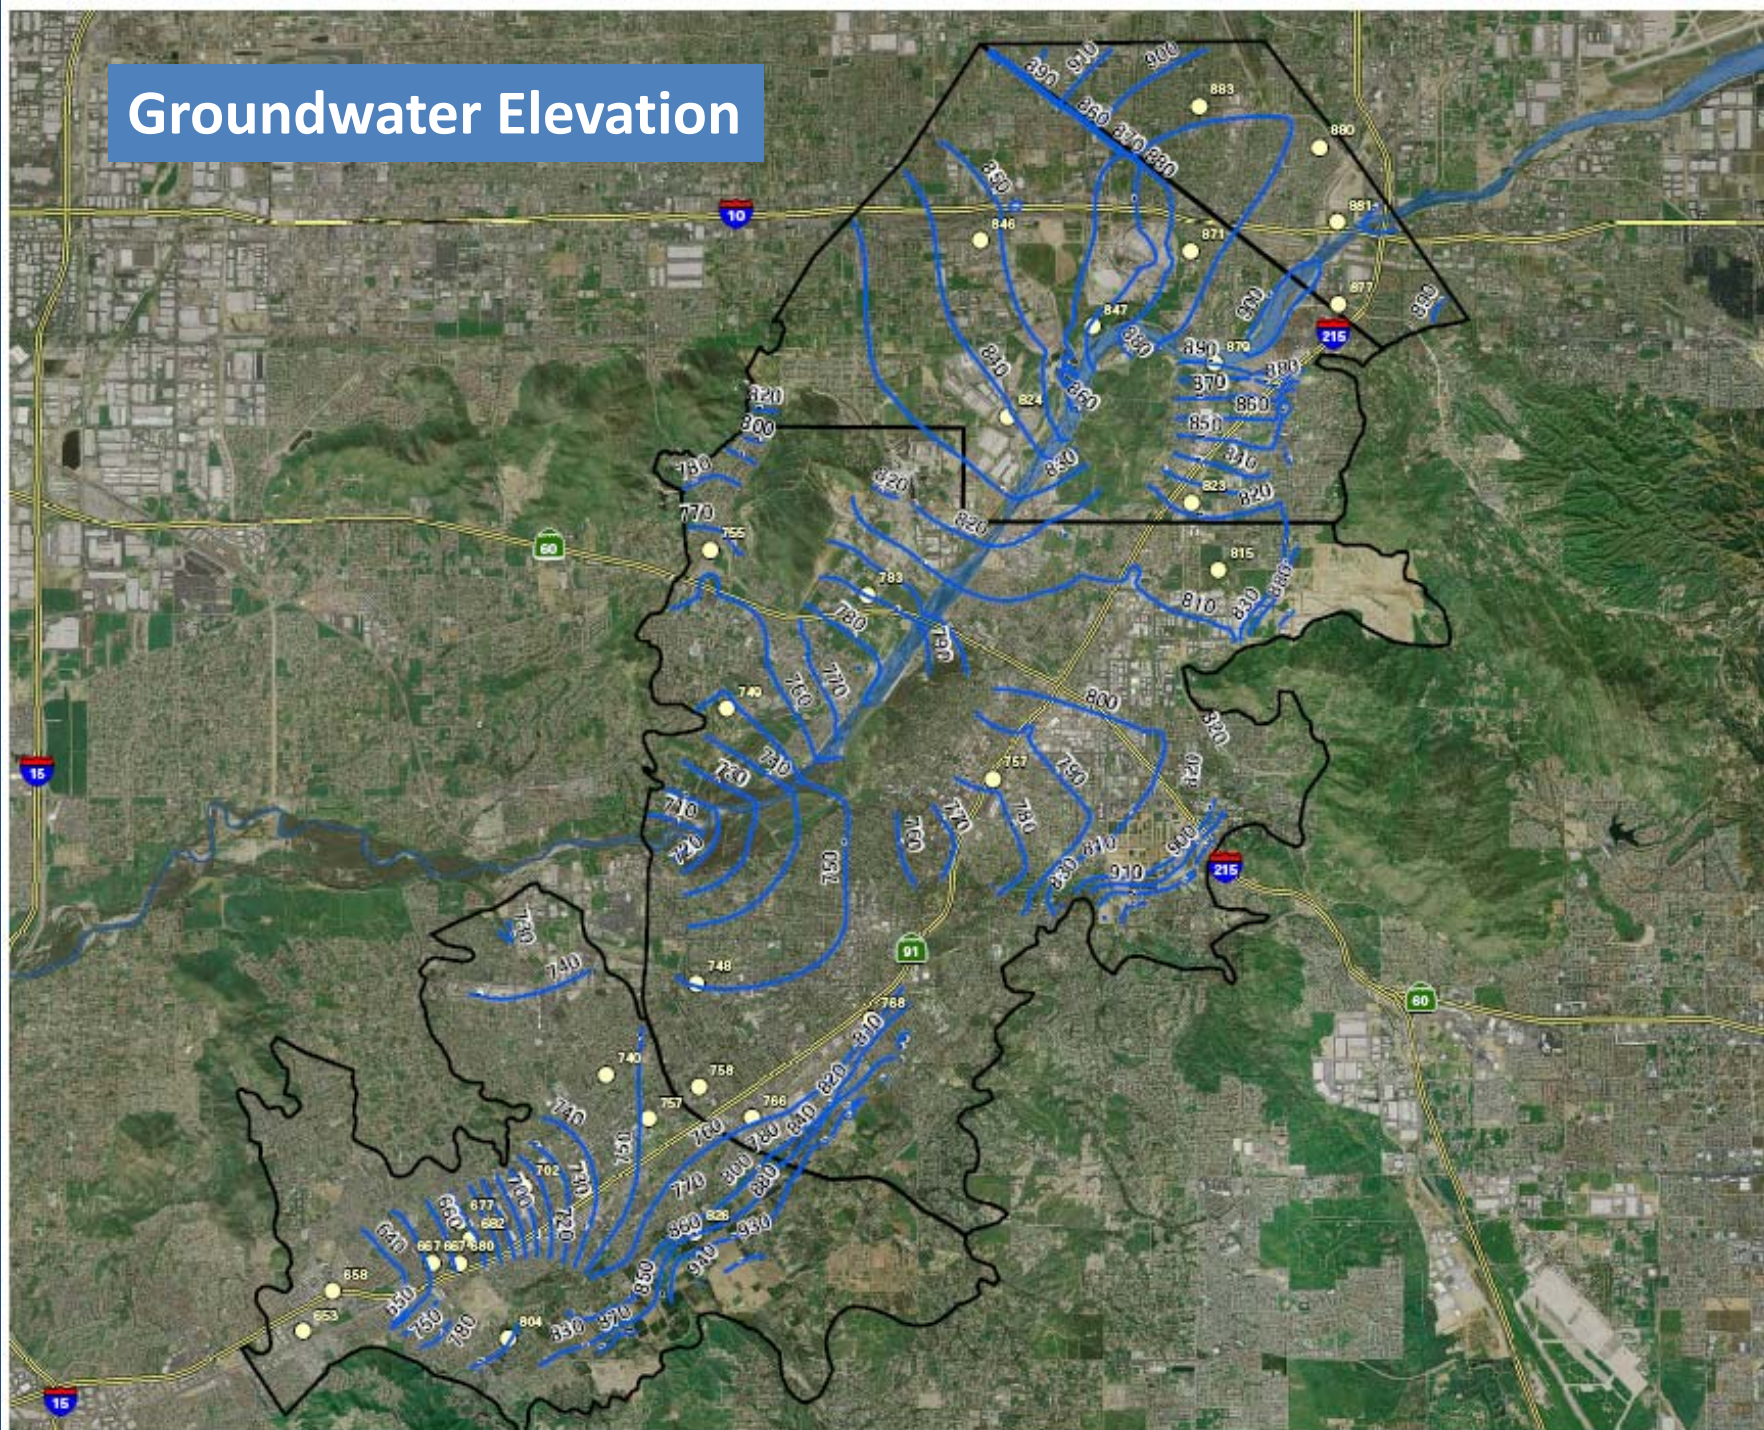

Study Area

Ground Surface Elevation

Groundwater Elevation

Data Source: Riverside County Flood Control and Water Conservation District

Annual Rainfall At Riverside Station 179

Figure 9
April 2010

Data Source: Riverside County Flood Control and Water Conservation District

Average Monthly Rainfall at Riverside Station 179
(1880 to 2008 Hydrological Conditions)

Figure 11
April 2010

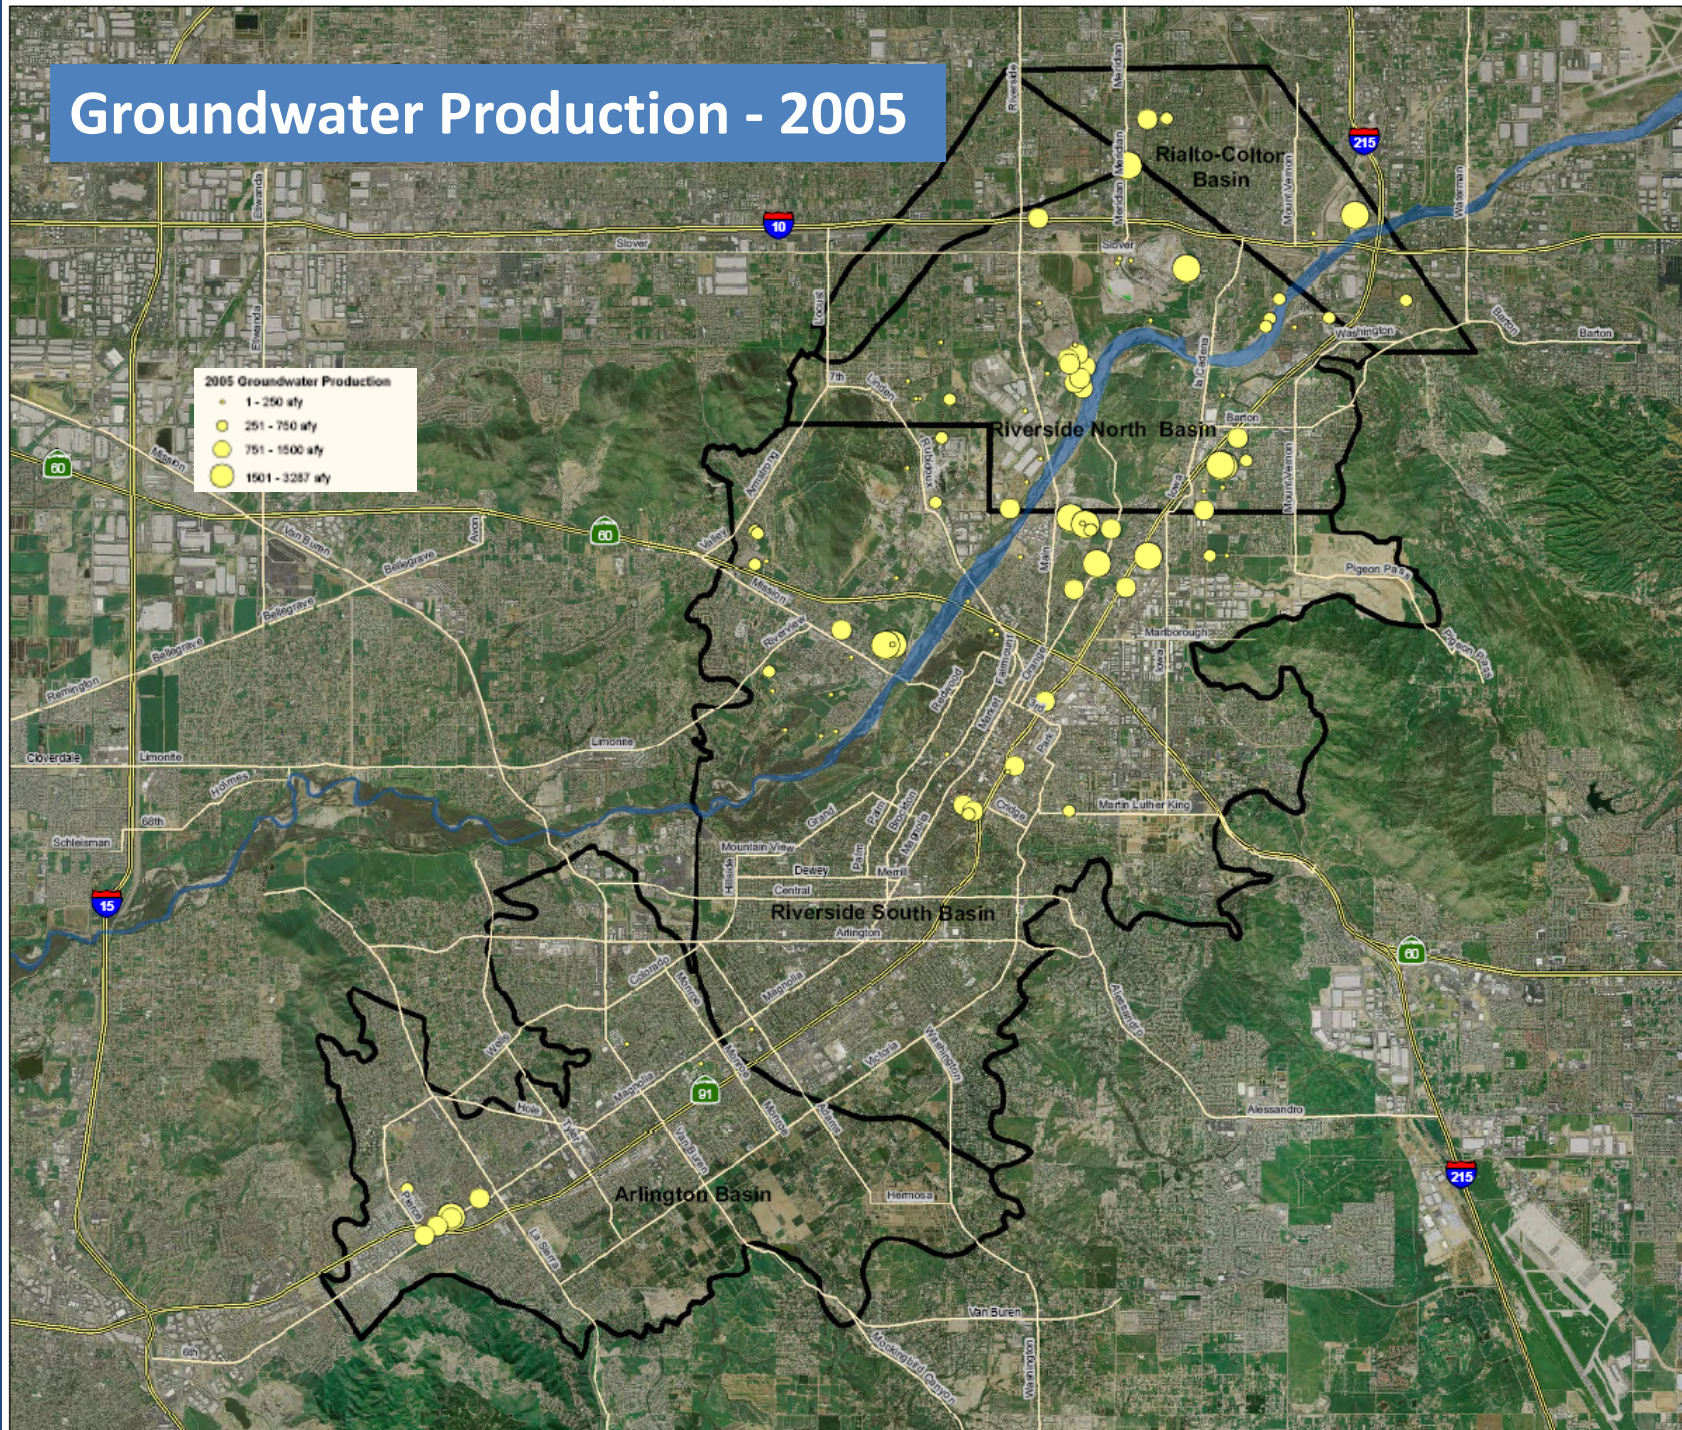

Santa Ana River Annual Inflows and Outflow, (AFY)

(Inflow is the sum of streamflows measured at USGS gages at Lytle Cr, Warm Cr, and E St. Outflow is measured at MWD Crossing.)

Figure 12
April 2010

Groundwater Production - 2005

Figure 24

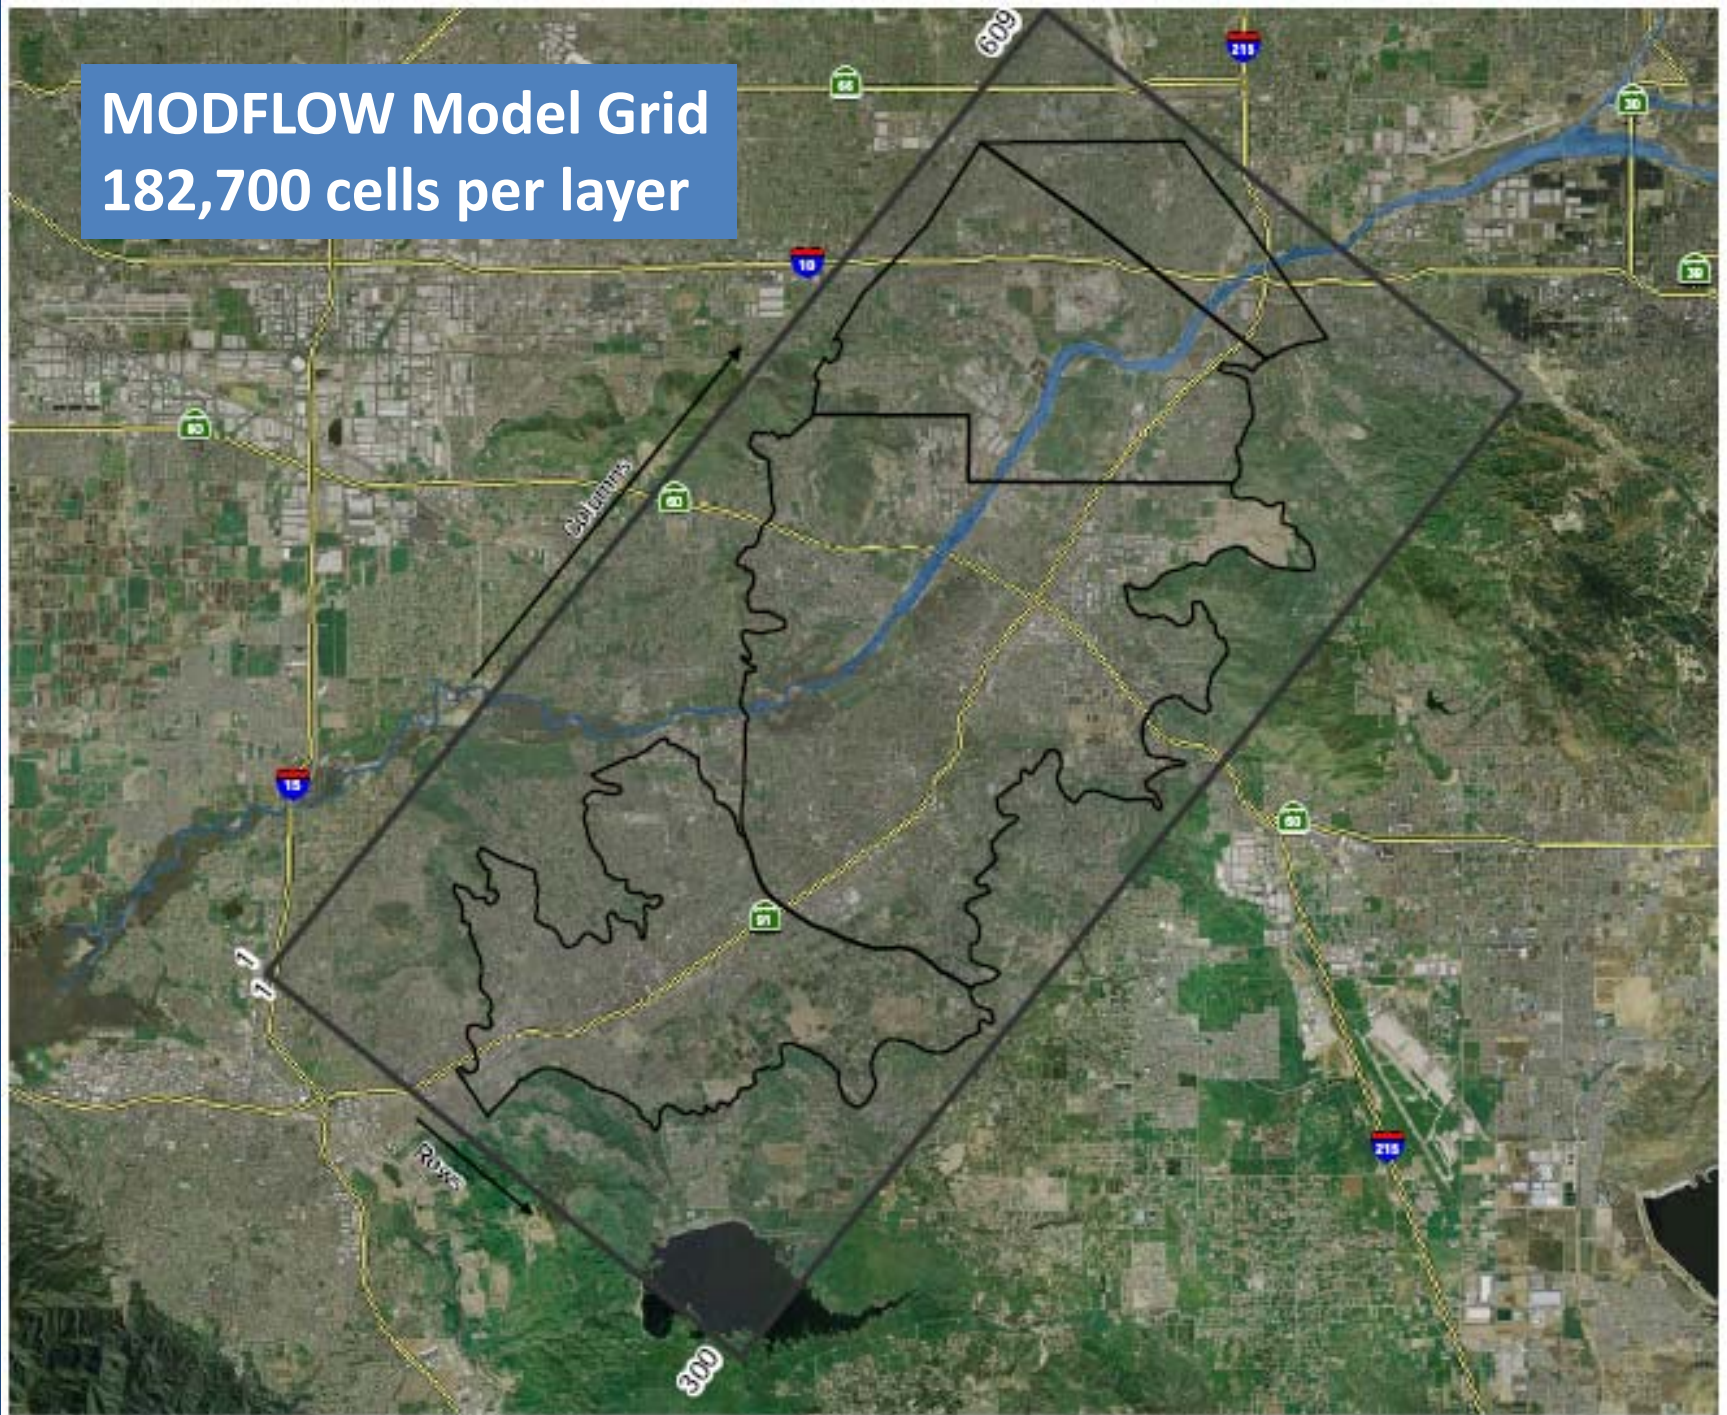

April 2010

Groundwater Production from Wells in Model Area

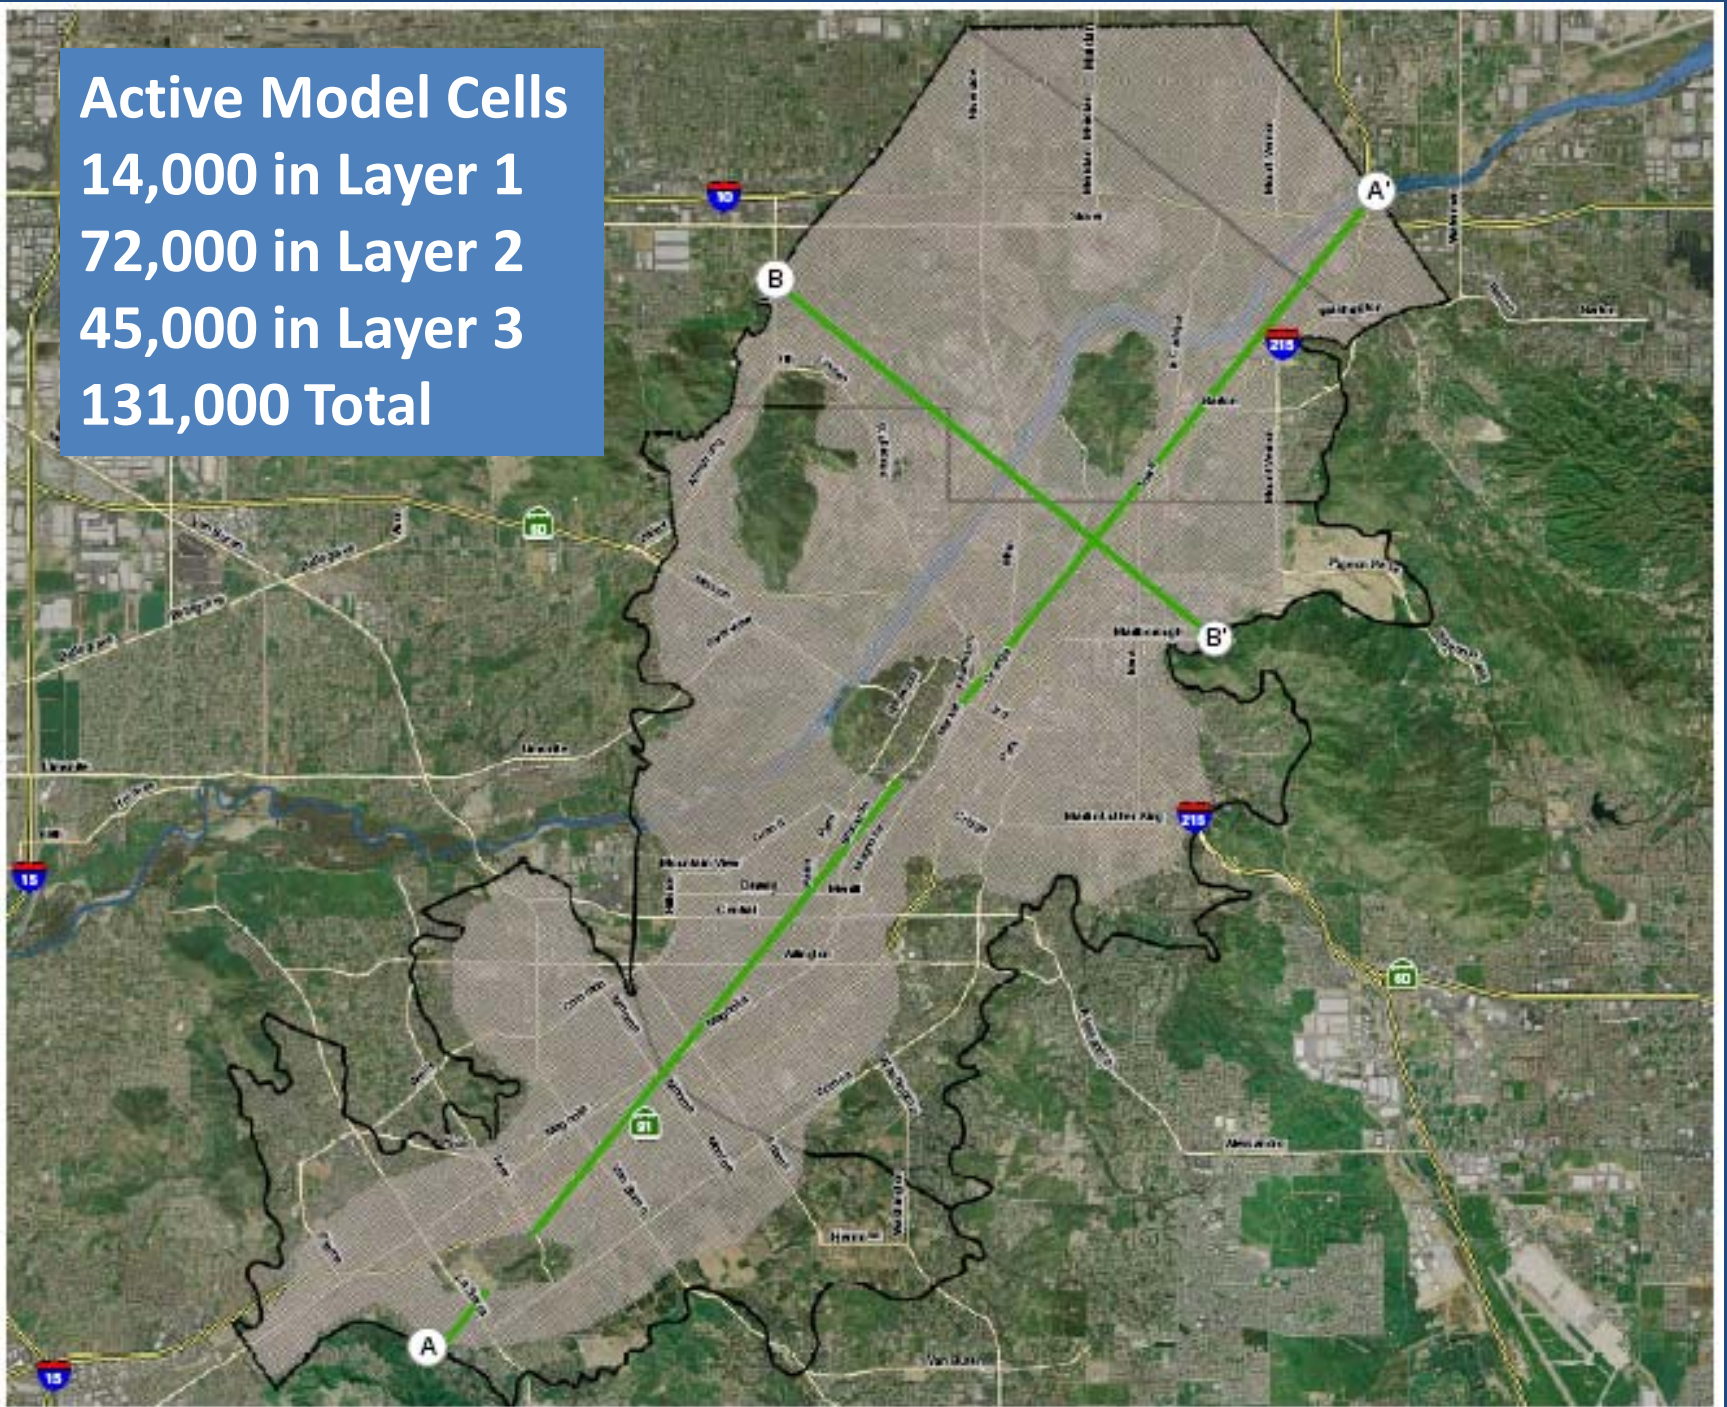

MODFLOW Model Grid

182,700 cells per layer

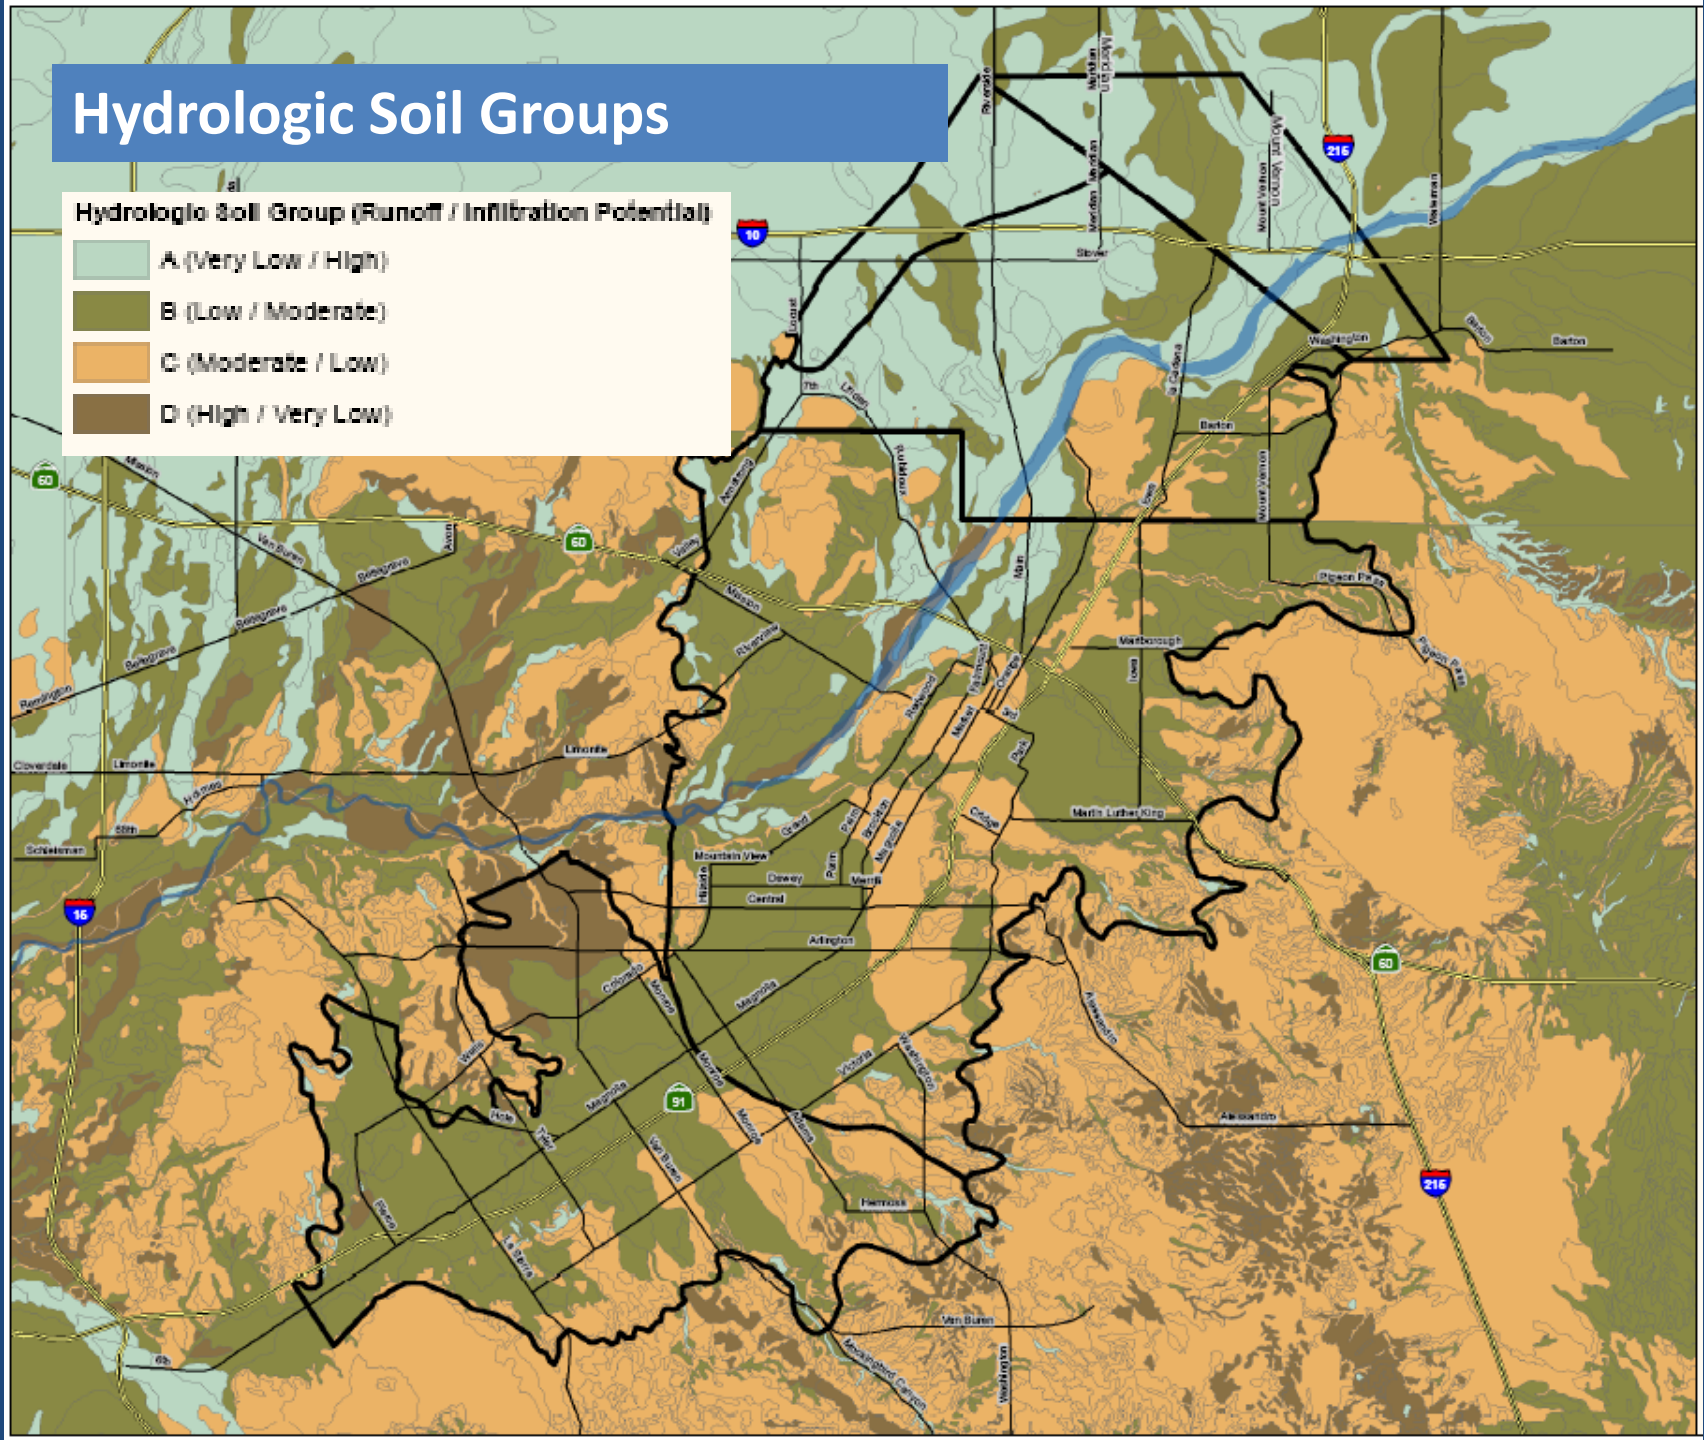

Active Model Cells
14,000 in Layer 1
72,000 in Layer 2
45,000 in Layer 3
131,000 Total

Hydrologic Soil Groups

Hydrologic Soil Group (Runoff / Infiltration Potential)

-  A (Very Low / High)
-  B (Low / Moderate)
-  C (Moderate / Low)
-  D (High / Very Low)

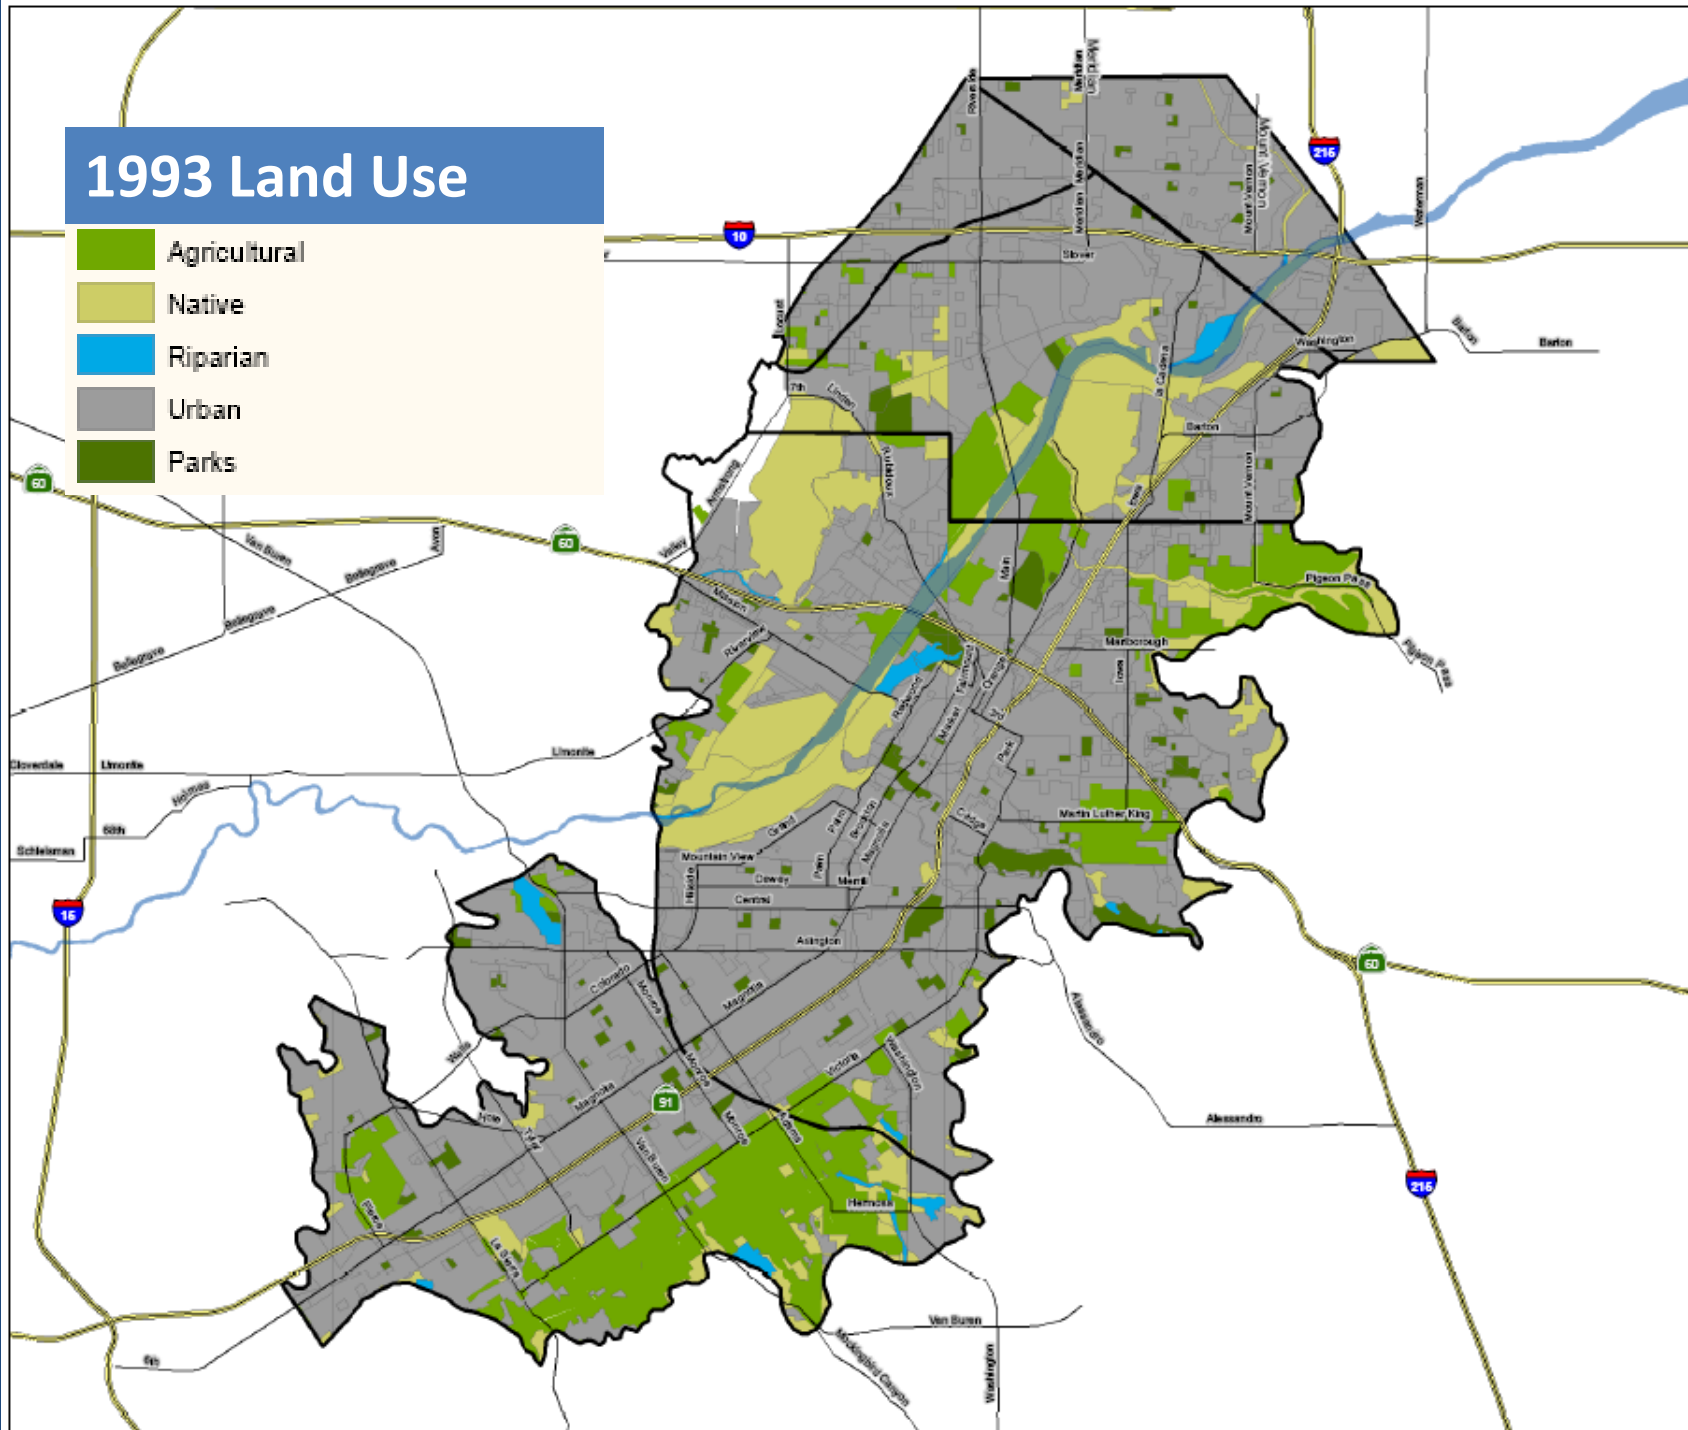

29 Small Watersheds

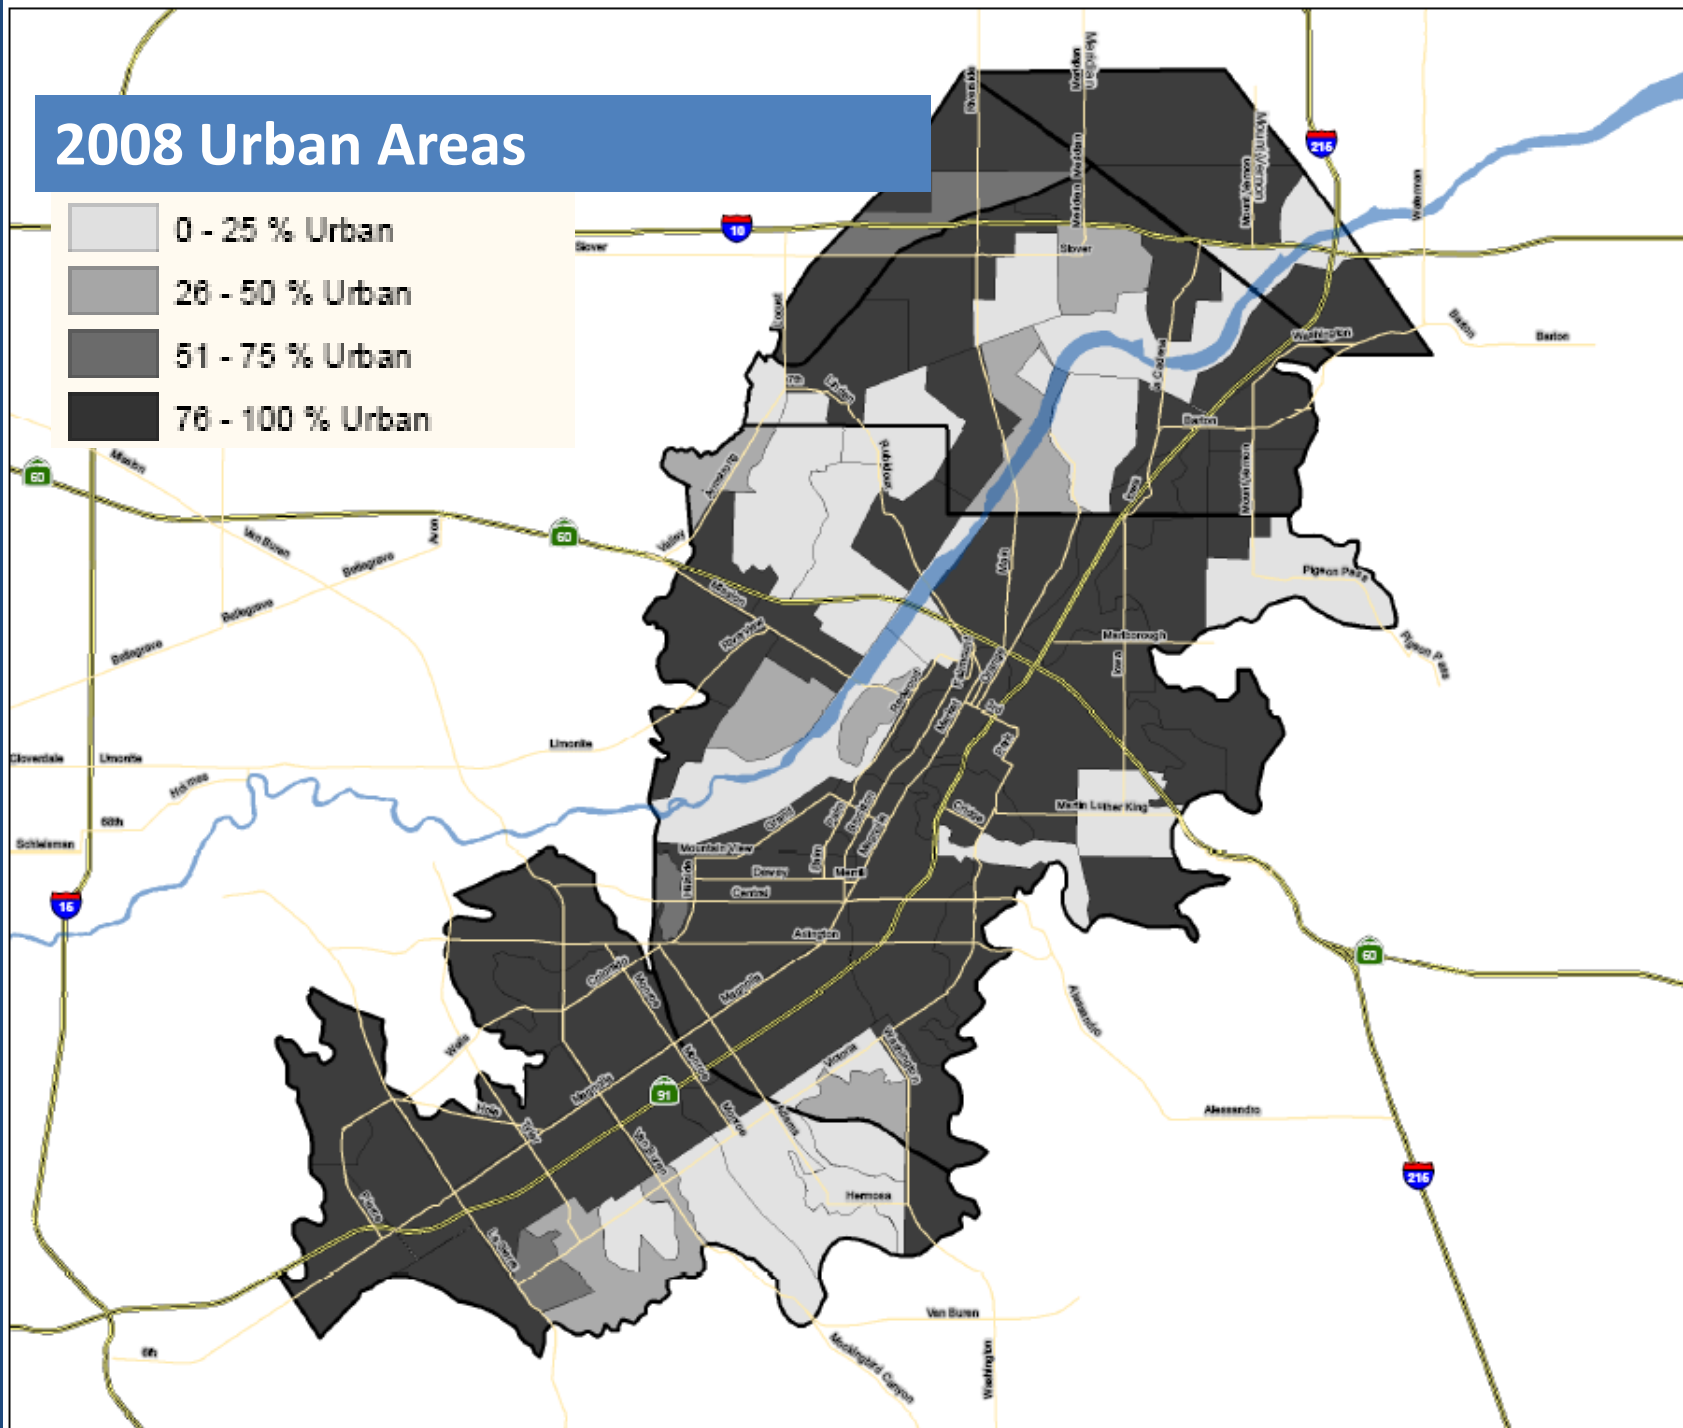

1993 Land Use

- Agricultural
- Native
- Riparian
- Urban
- Parks

2008 Urban Areas

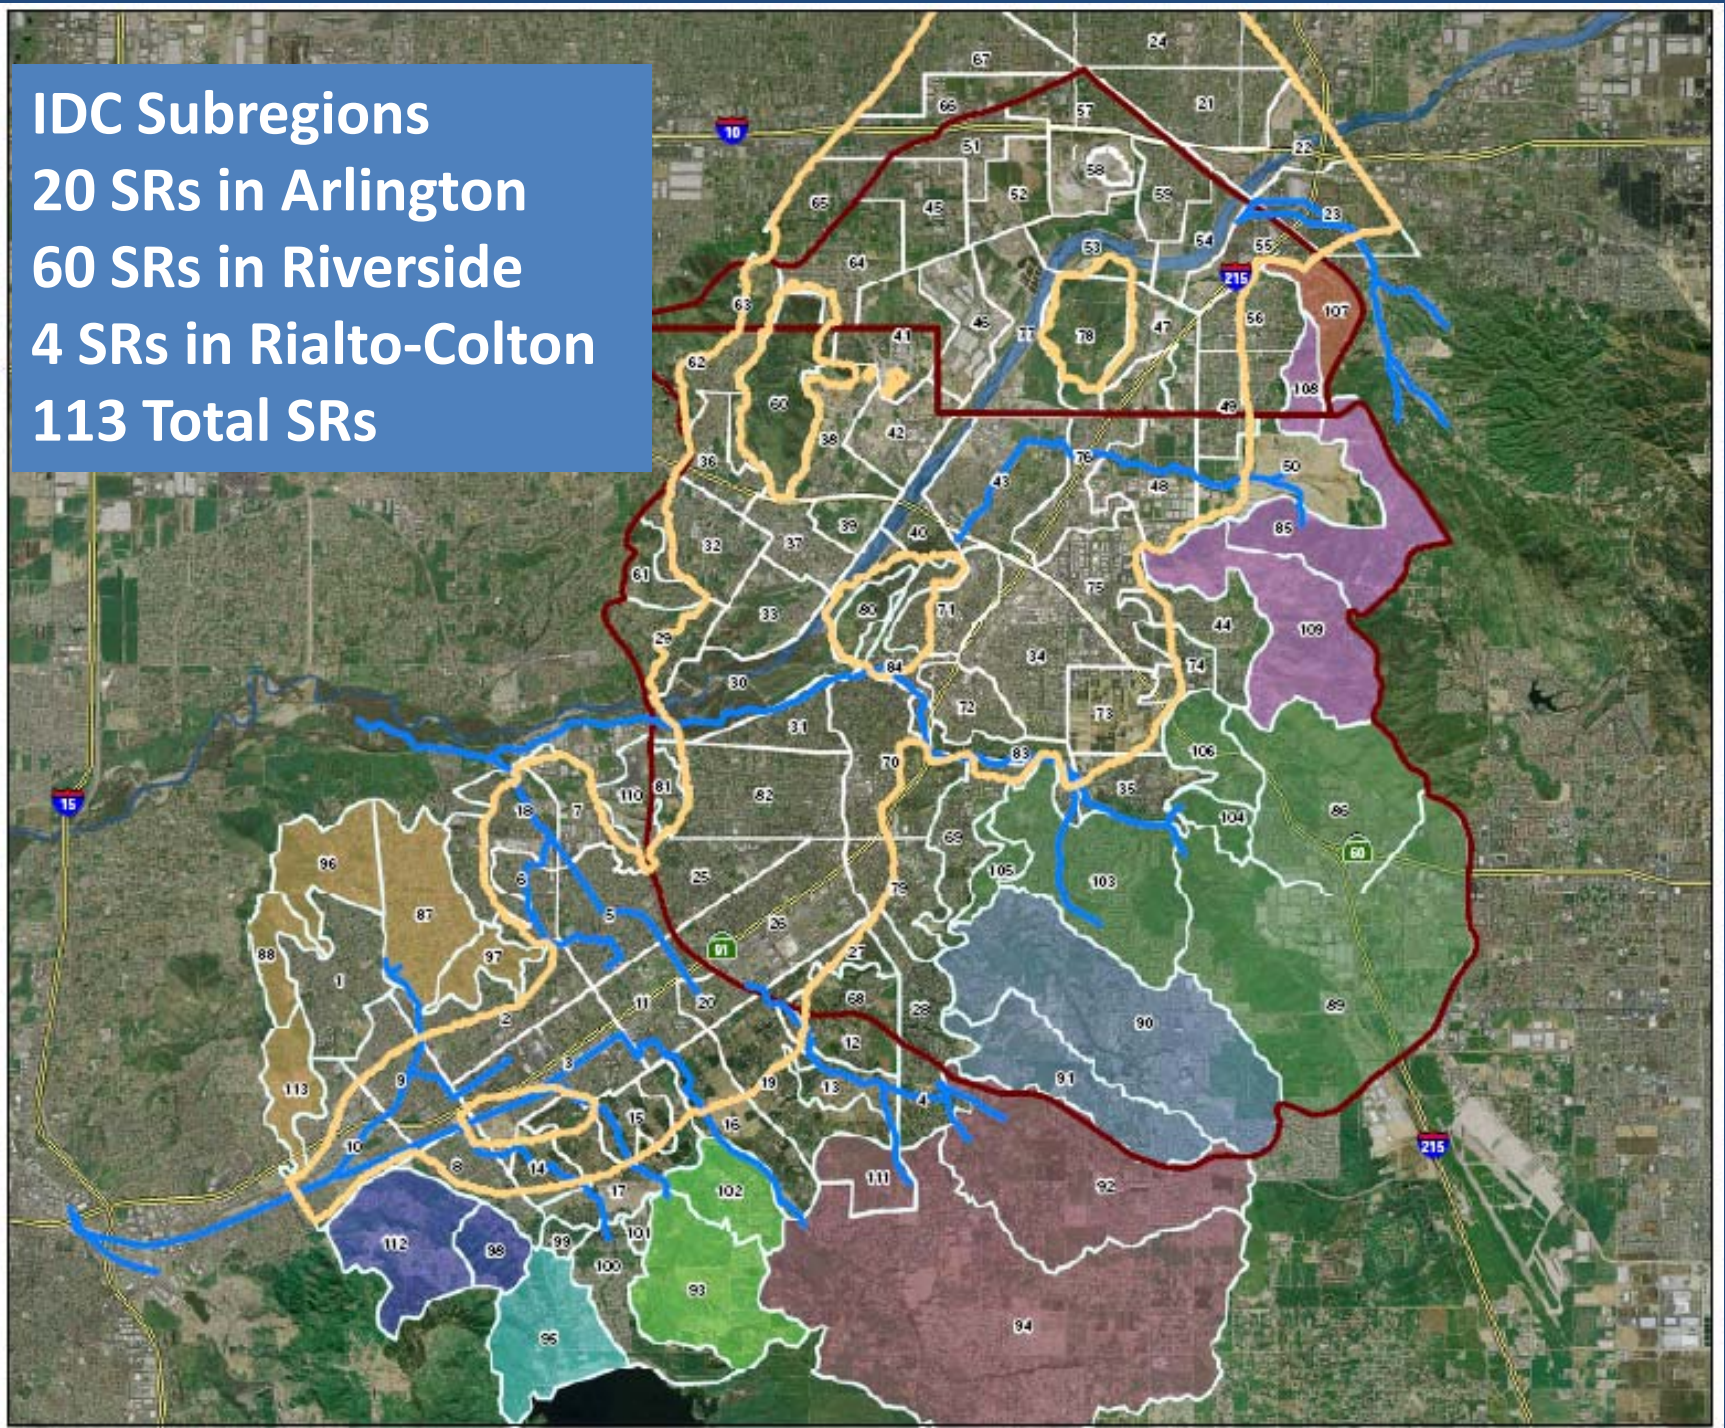

IDC Subregions

20 SRs in Arlington

60 SRs in Riverside

4 SRs in Rialto-Colton

113 Total SRs

Subregion	Basin	Soil Class	Land use (acres)				Total Area (acres)
			AG	URB	NV	PARK	
	Arlington		3,641	10,375	269	564	14,849
	Riverside		1,525	27,516	12,083	1,821	42,946
	Rialto-Colton		0	3,848	525	129	4,502
Total Model Area			5,167	41,739	12,877	2,515	62,297
	Small Watersheds		2,594	19,663	18,421	644	41,323

Calculation of Deep Percolation/Recharge Rates using IDC

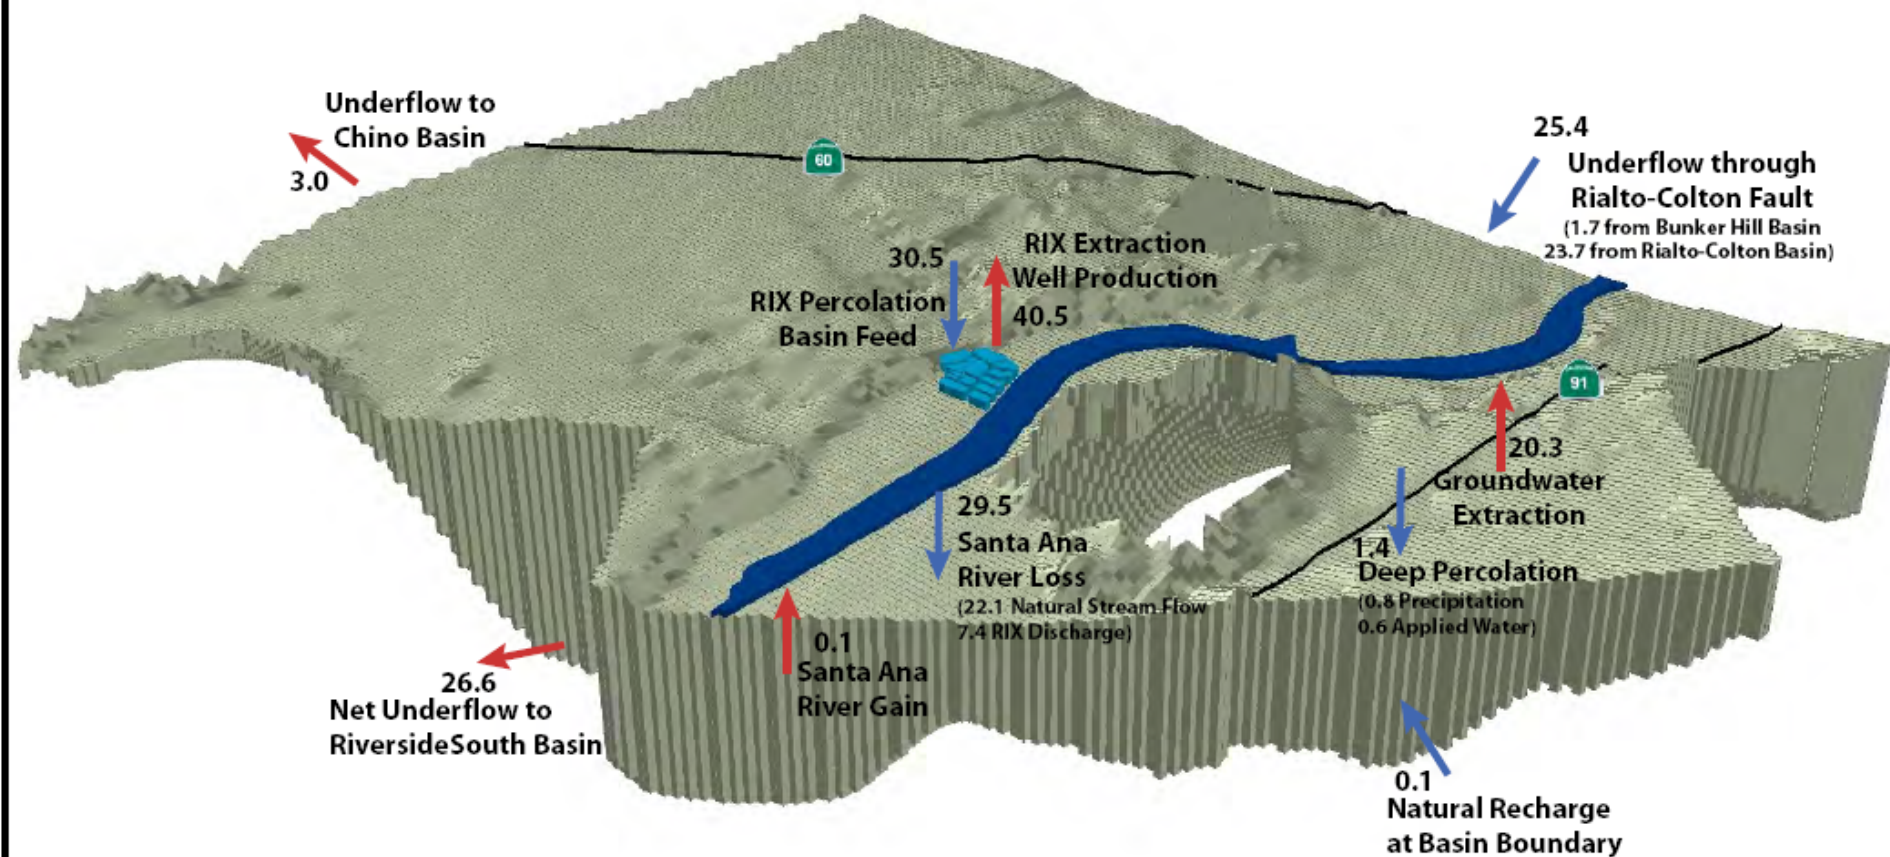

- IDC calculates deep percolation / groundwater recharge from:
 - Rainfall
 - Applied water
- IDC calculation are performed for subregions (areas with similar land use and soil type)
 - 84 subregions
 - 29 small watersheds
- Using GIS, IDC recharge rates are applied to MODFLOW model cells

IDC Model Summary

- Simulation Period: 1965 – 2007
- Time Step: 1 day
- Subregions: 113
- Crop Types: 2 (Parks and Citrus)
- Infiltration of Precipitation is computed (KINFILT = 0)
- No Reuse of Surface Runoff
- Daily Rainfall Data

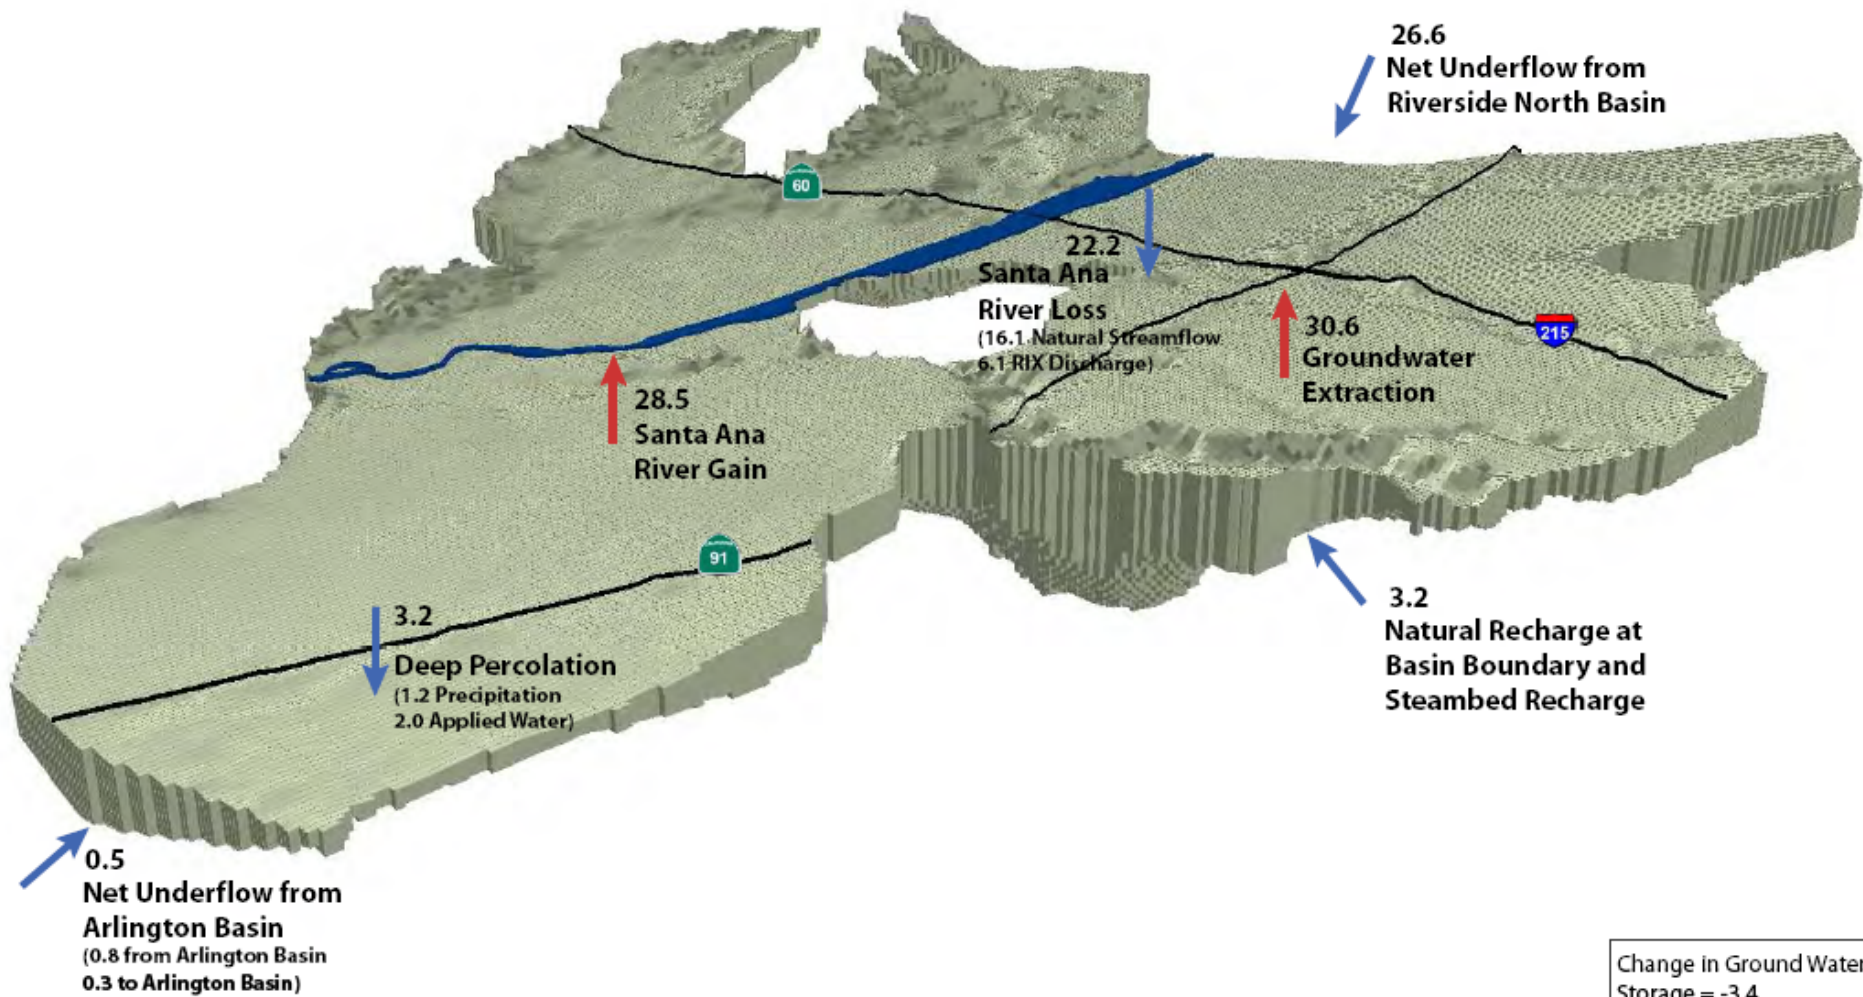

Consistency of IDC and MODFLOW Recharge Rates

Change In Ground Water
Storage = -3.7

Units in TAF/yr

THE END

MODFLOW Model

- Simulated Basins
 - Arlington, Riverside, southern parts of Rialto-Colton Basins in Riverside and San Bernardino Counties
- Model Grid
 - 95 square miles
 - Uniform cell size (50 m x 50 m)
